> DYNAMIC ROTATION TECHNOLOGY

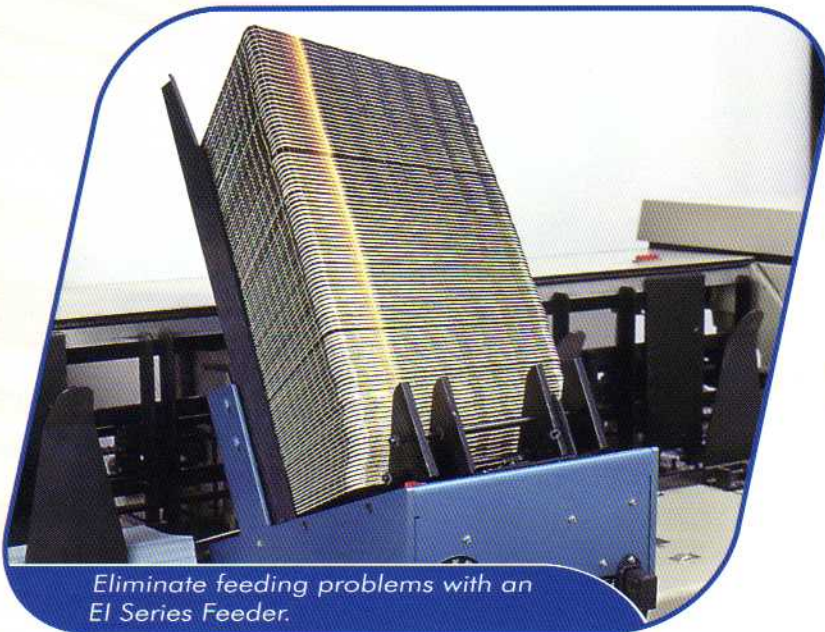

The key element in a good performance friction feeder is the method in which the feeder separates one sheet from the next. We achieve accurate separation of product through Dynamic Rotation Technology. The gold separator wheels counter rotate against the flow of material resulting in consistent wear surface throughout the life of the belts. By achieving an even wear surface it extends their useful life. The large diameter separator wheels are effective for feeding a wide range of materials from thin (.002") up to thick materials (.750") as well as odd shape and die-cut product.

Accurate separation each time with Dynamic Rotation Technology

> REPLACE-A-STATION

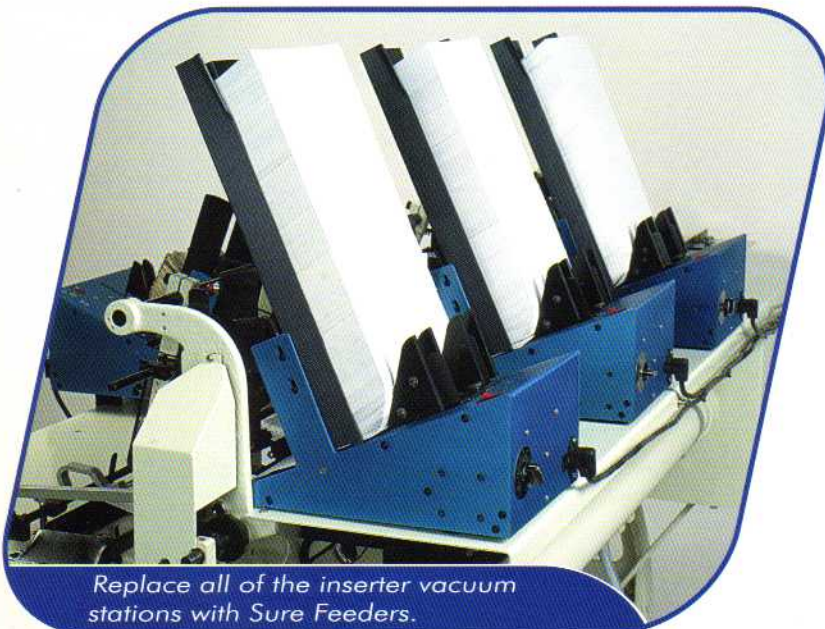

The EI Model feeder is designed to fit on the back of your current inserter, replacing a station to accurately present product to the gripper jaw. The EI feeder comes in two models the 900EI to replace stations on 6X9 inserters and the 1200EI to replace stations on 9X12 inserters. This feeder is compatible to Bell & Howell, Mailcrafter, EMC or Pitney Bowes swing arm inserters. This feeder eliminates the need for suction cups. The EI feeders fit side by side to replace all the standard vacuum feeding method on your inserter.

Eliminate feeding problems with an EI Series Feeder.

> INCREASED PRODUCTIVITY

If you are tired of hard to feed material causing jams in your inserter then replace it with a Sure-Feeder. Z-folds, coupon books, thin or open-ended material can all be fed by the EI Series Feeders. With less jams comes increased productivity and throughput that will pay for the feeder in no time at all.

Replace all of the inserter vacuum stations with Sure Feeders.

> VERSATILITY BY MOBILITY

This model is completely mobile and can be moved from one inserter to another in a matter of seconds. No wiring to the inserter is necessary - simply plug it into 110 VAC. Your existing miss and double detect remain in use.
